This anti-idiotype antibody is used to delay the development of, or treat, a human milk fat globule (HMFG) associated tumour in an individual having low tumour burden. The antibody 11D10 is used to prevent the recurrence of HMFG-associated tumours e.g. ovarian, non-small cell lung and pancreatic carcinoma, especially for treating breast tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                       /*tag= a /*tag= a //tagouct= antibody 11D10 light chain variable region" //transl_except= (pos:163..165, aa.Thr) //note= "no stop codon is given at the 3' end of the

                                                                                                                                                                                                                                                                                                                                                                         This cDNA sequence encodes the light chain variable region VL (AAM85149) of monoclonal anti-idiotype antibody 11D10 produced by hybridoma cell line ATCC 12020. 11D10 was obtained by immunising naive mice with MC-10 anti-iMFG antibody to obtain an anti-idiotype response. It elicits an immune response against a specific epitope of a high mol.wt. mucin of human milk fat globule (HMFC). It induces an immunological response to HMFG in mice, rabbits, monkeys and patients with advanced HMFG-associated tumours. Pharmaceutical compositions and vaccines comprising 11D10, 11D10 polypeptides and/or 11D10 polynucleotides are claimed. Also claimed are and alagnostic kits and methods of using 11D10, 11D10 polypeptides and/or 11D10 polynucleotides, including methods of treating HMFG-
                                                                                                                                                                                                                                                                                                    response

The invention comprises a method for delaying the development of, or treating a tumour that is associated with human milk fat globules (HMFG) or carcinoembryonic antigen (CEA). The method of the invention involves administering an anti-idiotypic antibody for HMFG (e.g. 11D10), and an anti-idiotypic antibody for CEA (e.g. 3H1). The method is useful for anti-idiotypic antibody for treating HMFG/CEA-associated tumours. The present cDNA sequence encodes the light chain variable region of the mouse 11D10 anti-idiotype antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The pref. vector or plasmid of the invention has a double-stranded DNA seq. coding for a variable region of a light or heavy chain of night, or for a variable region of a light or heavy chain of an immunoglobulin specific for an enzyme or surface protein. The sequence esp. codes for a variable region of a light chain having 95-115 AAs or for a variable region of a heavy chain having 110-125 AAs esp. including the D region of the heavy chain.
                                                                                        Sequence encoding the leader, variable region and first 16 AAs of the constant region of the kappa-chain (light chain) of MOPC41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Transformed expression vectors or plasmid(s) - with double stranded DNA sequence coding only for desired part of polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes mouse light chain variable region. This recombinant DNA is derived from PCR A which amplifies antibody light chain variable region (VL). The transformant produced using the VL gene was used transform competent E. coli cells. The peptide produced by transformants neutralises interleukin-18. This is useful for treating and preventing immunopathies, inflammatory disorders and autoimmune diseases which are caused by excessive immunoracaction. The peptide has anti-allergic, anti-inflammatory, immunosuppressive, hematopoietic, leukocytopoletic, antilalgic, antilpyretic and hepatic-function improving

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               99
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel recombinant conjugate antibody molecules comprise a monocional antibody specific for a surface structure of antigen presenting cells (APC), genetically modified to contain at least one antigen exclusively at one or more preselected sites. The conjugate is capable of delivering the antigen to APC and eliciting an immune response to the antigen. The new conjugates are useful as vaccines and are able to elicit an enhanced immune response without the use of an adjuvant. In a specific example, a conjugate was constructed using the murine anti-human class II monoclonal antibody secreted by hybridoma 44H104. The peptide CITB36 was chosen as antigen; it consists of a tandemly linked T and B cell epitope derived from HIV MN strain. The present sequence encodes the light chain variable region which was PCR amplified from 44H104 and used in the preparation of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LeuThrCysArgAlaSerGlnAspIleGlyIleAsnLeuHisTrpLeuGlnGlnGluPro

Novel recombinant conjugate antibody, useful as a vaccine against pathogens having a specific antigen, comprises a monoclonal antibody specific for an antigen presenting cell surface structure -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a recombinant conjugate antibody, comprisin a monoclonal antibody specific for a surface structure of antigen for senting cells genetically modified to contain an antigen moiety for the purpose of delivery of the antigen moiety to antigen. Presenting cells of the immune system. The conjugate antibody is formulated as a vaccine to protect a host against a disease caused by a pathogen expressing the antigen. The antibody is useful as a detecting agent. The present sequence is murine 44H104 mab variable

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AspGlyThrIleLysArgLeuIleTyrAlaThrSerSerLeuGlySerGlyValProLys 80
                               c-erbB-2 refers to a protein antigen expressed on the surface of tumour cells, such as breast and ovarian tumour cells, which is an approx. 200,000 mol. wt. acidic glycoprotein having an isoleterric pt. of about 5.3 (see AAQ6603, ARN39568). A single chain FV (sFV) is a covalently linked VH-VL heterodimer which is expressed from a peptide-encoding linker. Such linker sequences are set forth in AA residues 116-135 in AAR39569, which includes part of the 16 AA linker sequences in AAR39572. Using AAQ46084 for the 520C9 monoclonal antibody, a single chain polypetide can be produced having a mithody for a c-erbB-2 related antigen. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LeuThrCysArgAlaSerGlnAspIleGlyIleAsnLeuHisTrpLeuGlnGlnGluPro

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AGGTTCAGTGGCAGTCGGTCTGGGTCAGATTATTCTCTCACCATCAGTAGCCTTGAGTCT
                                                                                                                                                                                                                                                                                                                                                                                               Variable heavy (VH) and variable light (VL) genes were cloned from a 520C9 hybridoma cDNA library, using probes directed toward the antibody constant and joining regions. A two single chain Fv (SFV) gene was constructed by connecting the VH and VL genes with a Ser rich polypeptide linker. The resulting 520C9 two SFV gene, transformed into E. coll, and protein expression vector, transformed into E. coll, and protein expression induced by the addn. of IPPG to the culture medium. A companion comprising a carrier and the 2 SFV protein prod. can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     used for in vivo imaging, and drug targetting experiments. The S FV protein prod. is a homodimer, in which both fragments target the same antigen, therefore giving greater binding avidity and longer tissue retention times, compared to individual sFV protein
                                                                                                                                                                                                                                                                                         Compsns. contg. antigen-targetting antibody fragment constructs comprising dimer of single-chain Fv fragments

This was constructed by connecting the Vh and VI genes with a DNA sequence encoding a Serine rich linker. 520C9 is a monoclonal antibody useful in targeting c-erbb-2 antigen. This dimeric construct can be used in the methods of invention of imaging a preselected antigen expressed in a mammal. The methods are used in magnetic resonance imaging of c-erbb-2 or related antigens in cancer diagnosis. The biosynthetic constructs have enhanced properties as in vivo targetting agents in comparison with intact monoclonal antibodies or their Fab fragments. The dimeric constructs permit the in vivo targetting of an epitope on an antigen with greater apparent avidity, including greater tumour specificity, tumour localisation and tumour retention properties than that of the Fab fragment having the same CDRS as the construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Imaging of antigens in vivo - using dimers of single-chain antibody

```

```
The present sequence encodes an an antibody 520C9 sFV. Variable heavy and light sequences of antibody 7520C9 are connected, together with a serine linker, to produce the present single chain FV gene. The present sequence exemplifies the invention. Dimers of the single chain FV are used for targeted delivery of drugs or imaging agents (e.g. cytotoxins,

The present cDNA sequence derived from hybridoma #125-2H, encodes mouse anti-Interleukin-18 antibody 11ght chain variable region (VL). It can be used in the production of recombinant monoclonal antibody #125-2HmAb, which is capable of neutralising biological activities of interleukin-18. The antibody has antiinflammatory; immunosuppressive, leucocytopoietic, antialisty, antigoredic, antialisty and can be used for prevention and treatment of autoimmune diseases, immunopathies and inflammatory disorders caused by excessive immunoreaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, casophagus, colon, liver, intrahepatic bile ducts, pancreas, lung, laryn, breast, ovariy, uterus, cervix, prostate, kidney, testis, thyroid, bladder or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, protatoza or helminths. The autoimmune diseases include multiple sclerosis, Grave's disease, ankylosing spondylitis, acute anterior uveitis, Goodpasture's syndrome, myasthenia gravis, insulin-dependent autoimmune hepatitis. The sequences represent DNA encoding the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                   Multifunctional polypeptides comprising binding sites that specifically recognise extracellular groups of the NKG2D receptor complex and domains which function as receptors or ligands, useful for treating cancers and infectious diseases

The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated cas a receptor or ligand. The polypeptide and its associated composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, cosophagus, colon, liver, intrahepatic bile ducts, pancreas, lung, cary, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, larged or brain, or a melanoma, myeloma, sarcoma, leukaemia or lymphoma. The infectious diseases can be caused by viruses, bacteria, fungi, protozoa or helminths. The autoimmune diseases include multiple conditis, goodpasture's syndrome, myasthenia gravis, insulin-dependent diabetes mellitus, rheumatoid arthritis, pemphigus vulgaris and autoimmune hepatitis. The sequences represent DNA encoding the copy propertions.
                                                                                                                                                                                                                                                                     Human; NKG2D; NKG2D receptor complex; cancer; infectious disease; tumour; autoimmune disease; head; neck; stomach; oesophagus; colon; liver; ovary; intrahepatic bile duct; pancreas; lung; larynx; breast; uterus; cervix; prostate; kidney; testis; thyroid; bladder; brain; malanoma; myeloma; resroma; leukaemia; lymphoma; virus; bacterium; fungus; protozoan; ds; pelminth; cytostatic; antimicrobial; immunomodulatory; p4-2; p4-3; p4-14; p4-15; p5-2; p5-3; p5-9; p5-10; p5-11; p5-23; 3Bloxp4-3; 3Bloxp4-14;

The sequence encodes the interleukin-2 (IL-2) chimeric antibody chain clone 447. Antibodies against IL-2 receptors are useful as immunosuppressants, and are much less immunogenic than mouse or rat antibodies. The DNA sequence provides much higher yields of chimeric antibodies than known methods. See also AAQ15114-Q15118 (Updated on 25-MAR-2003 to correct PI field.)

Database :
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LeuThrCysArgAlaSerGlnAspIleGlyIleAsnLeuHisTrpLeuGlnGlnGluPro
                                                                                                                                                                                                                                                  This cDNA sequence encodes the light chain variable region VL (AAW85149) of monoclonal anti-idiotype antibody 11D10 produced by hybridoma cell line ATCC 12020. 11D10 was obtained by immunising nealve with MC-10 anti-HMFG antibody to obtain an anti-idiotype response. It elicits an immune response against a specific epitope of a high mol.wt. mucin of human milk fat globule (HMFG). It induces an immunological response to HMFG in mice. Tabbits, monkeys and patients with advanced HMFG-associated tumours. Pharmaceutical compositions and vaccines comprising 11D10, 11D10 polypeptides and/or 11D10 polynucleotides are claimed. Also claimed are and/or 11D10 polynucleotides, including methods of treating HMFG-associated tumours.

This anti-idiotype antibody is used to delay the development of, or treat, a human milk fat globule (HMFG) associated tumnour in an individual having low tumnour burden. The antibody 1D10 is used to prevent the recurrence of HMFG-associated tumnours e.g. ovarian, non-small cell lung and pancreatic carcinoma, especially for treating breast tumnours.
